

# AEC-NASA TECH BRIEF

AEC-NASA Tech Briefs describe innovations resulting from the research and development program of the U.S. AEC or from AEC-NASA interagency efforts. They are issued to encourage commercial application. Tech Briefs are published by NASA and may be purchased, at 15 cents each, from the Clearinghouse for Federal Scientific and Technical Information, Springfield, Virginia 22151.

## Recommended Values of the Thermophysical Properties of Eight Alloys, Their Major Constituents and Oxides

Technical personnel who design, fabricate, and manufacture products, components, processes, and systems which involve extreme temperature environments such as cryogenic and high temperatures to and beyond the melting range require the knowledge of the thermophysical properties of the basic alloys, their constituents and oxides that would be utilized. A single reference work has been prepared that provides in tabular and graphical form the recommended properties of specific heat, thermal conductivity, viscosity, thermal emissivity, thermal diffusivity, density, and surface tension of aluminum, aluminum alloys, inconel, titanium, beryllium and stainless steel.

The data are contained in the technical report: "Recommended Values of the Thermophysical Properties of Eight Alloys, Major Constituents and their Oxides," edited by Y.S. Touloukian, Thermophysical Properties Research Center, Purdue University, Lafayette, Indiana, February 1966.

The table shown represents the materials studied and the properties for which data were available. It should be noted that serious gaps of information exist in the literature for several of the properties for most

of the materials studied. An effort was made to fill in these gaps wherever feasible through theoretical or semiempirical considerations. Some of the data were also extrapolated whenever it was believed justifiable within the limits of tolerances set for most engineering applications.

### Note:

Copies of the report are available from:
